

ASSASSIN ROLE ASSIGNMENT

BY ERAM MANASIA

FEATURES

- User has two options in the beginning. If the user's group does not have a narrator, the app will choose one for the group.
- User can enter names of the group members separated by commas. The name has to be at least a single character.
- App will generate spinner on how many murderers can be chosen. The number is pre-coded in the app
- The app lets the narrator know roles of the group members.
- The roles of group members are randomly generated by using Secure Random

WHAT DATA STRUCTURES WERE USED?

- ArrayList : An ArrayList of Strings is used for the names.
- HashMap : App has a hashmap for role assignment. Keys are narrator(if user not chosen), doctor, and murderer(s)
- HashSet: The hashset is used to check that there are no duplicates. If the size of the hashset is less than the size of the arraylist then we know there is a duplicate.

WHAT WERE THE CHALLENGES FACED WHAT DID YOU LEARN?

- Figuring out how to send data from one screen to another. I solved this using Intents.
- Rules of how many murderers and having that sent to the spinner. Pre coded this into the project and it is generated depending on the size of the arraylist.
- Duplicate checking. Solved this using hashset

WHAT DID YOU LEARN?

- The internet is your best friend!
- The importance of wireframes. I had to redo the screens and because I had wireframes, it didn't take a long time.
- Check what languages and tools you are using before you start -.- . I found out after doing my screens that I was using Kotlin so I had to redo the project.

WHAT ELSE WOULD YOU HAVE LIKED TO ADD TO YOUR PROJECT?

- Single hand held -> Multi hand held
 - Notification on what you are
- Log in
 - Each user can add, save, remove, and edit a “group”
- Have add,edit, and remove button for adding names

I have completed everything that was in my proposal. These are features that I would've had added if I had more than 2 weeks.
